Abstract

Brief description of the problem, method, and results.

$$a = \frac{b}{c}$$

1 Introduction

Artificial intelligence systems have advanced rapidly in recent years.

Recent work such as introduced architectures that significantly improved sequence modeling tasks.

In this work we investigate methods for improving project portfolio optimization using reinforcement learning.

1.1 Motivation

Efficient resource allocation is critical in large-scale projects.

1.2 Contributions

The contributions of this paper are:

- A reinforcement learning framework for project portfolio optimization
- A simulation environment for portfolio budgeting
- Empirical evaluation of PPO-based agents

2 Method

2.1 Problem Formulation

We define the dataset as

$$D = \{(x_i, y_i)\}_{i=1}^N$$

where x_i represents project features and y_i represents expected outcomes.

2.2 Model Architecture

[width=0.7]figures/architecture.png

Figure 1: System architecture

2.3 Training Objective

The agent learns a policy

$$\pi_{\theta}(a|s)$$

that maximizes expected reward.

3 Experiments

3.1 Experimental Setup

Experiments were conducted using:

- Framework: PyTorch
- Algorithm: PPO
- Hardware: GPU

3.2 Datasets

Experiments were conducted on simulated project portfolios.

3.3 Results

Method	Return	Success Rate
Baseline	0.72	0.68
PPO Agent	0.85	0.81

Table 1: Experimental results

4 conclusion

Summarize your contributions and possible future work.
